Homework 4

<u>Due Date</u>: Thursday, Feb 6^{th} , 2020 at 11:59pm

1. Computing Eigenvalues and Diagonalization

Compute eigenvalues and right eigenvectors for each of the following matrices. Write out a diagonalization for each matrix. If the matrix has complex eigenvalues, then write it in both of these forms.

$$\begin{bmatrix} | & | \\ \frac{1}{\sqrt{2}}(u-vi) & \frac{1}{\sqrt{2}}(u+vi) \\ | & | \end{bmatrix} \begin{bmatrix} a+bi & 0 \\ 0 & a-bi \end{bmatrix} \begin{bmatrix} -\frac{1}{\sqrt{2}}(w^T+y^Ti) - \\ -\frac{1}{\sqrt{2}}(w^T-y^Ti) - \end{bmatrix} = \begin{bmatrix} | & | \\ u & v \\ | & | \end{bmatrix} \begin{bmatrix} a & -b \\ b & a \end{bmatrix} \begin{bmatrix} -w^T - \\ -y^T - \end{bmatrix}$$

(a) (PTS: 0-2) Eigenvalues, (PTS: 0-2) Eigenvectors, (PTS: 0-2) Diagonal form, (PTS: 0-2), Complex form?

$$A = \frac{1}{2} \begin{bmatrix} 3 & -1 \\ -1 & 3 \end{bmatrix}$$

(b) (PTS: 0-2) Eigenvalues, (PTS: 0-2) Eigenvectors, (PTS: 0-2) Diagonal form, (PTS: 0-2), Complex form?

$$A = \begin{bmatrix} 1 & 1 \\ -2 & -1 \end{bmatrix}$$

(c) (PTS: 0-2) Eigenvalues, (PTS: 0-2) Eigenvectors, (PTS: 0-2) Diagonal form, (PTS: 0-2), Complex form?

$$A = \begin{bmatrix} -1 & -1 \\ 1 & -1 \end{bmatrix}$$

2. Cayley-Hamilton Theorem

- (a) (PTS: 0-2) The eigenvalues of a matrix A are roots of its characteristic polynomial, $\chi(\lambda) = \det(\lambda I A)$, ie. $\det(\lambda_i I A) = 0$ if λ_i is an eigenvalue of A. Show that $\chi(A) = \mathbf{0}$ (where **0** is a matrix of zeros). (Hint: use the spectral mapping theorem).
- (b) **(PTS: 0-2)**. Suppose that $\chi(\lambda) = \det(\lambda I A) = \lambda^3 2\lambda^2 + \lambda 1$. Use Cayley-Hamilton to write an expression for A^6 in terms of A^2, A, I . Note that when you plug the matrix A into $\chi(\cdot)$ you replace each constant with that constant times the identity matrix, ie. $\chi(A) = A^3 2A^2 + A I$.

3. Rotation Matrices and Complex Eigenvectors

Consider the two rotation matrices

$$R_1 = \begin{bmatrix} \cos \theta_1 & -\sin \theta_1 \\ \sin \theta_1 & \cos \theta_1 \end{bmatrix}, \quad R_2 = \begin{bmatrix} \cos \theta_2 & -\sin \theta_2 \\ \sin \theta_2 & \cos \theta_2 \end{bmatrix}$$

- (a) (PTS: 0-2) Show that R_1 and R_2 commute, i.e. $R_1R_2 = R_2R_1$ (Note that most matrices do not commute. 2×2 rotation matrices are an exception.)
- (b) (PTS: 0-2) Compute the inverse of R_1 .
- (c) (PTS: 0-2) Give a physical interpretation of R_1R_2 and R_1^{-1} related to the angles θ_1 and θ_2 .
- (d) (PTS: 0-2) Consider a 2×2 real matrix A that can be diagonalized as

$$A = \frac{1}{\sqrt{2}} \begin{bmatrix} | & | \\ (u - vi) & (u + vi) \\ | & | \end{bmatrix} \begin{bmatrix} re^{i\theta} & 0 \\ 0 & re^{-i\theta} \end{bmatrix} \begin{bmatrix} | & | \\ (u - vi) & (u + vi) \\ | & | \end{bmatrix}^{-1} \sqrt{2}$$

where $r \in R_+$ and $u, v \in R^2$. Show that another valid diagonalization for A is

$$A = \frac{1}{\sqrt{2}} \begin{bmatrix} | & | \\ (u' - v'i) & (u' + v'i) \\ | & | \end{bmatrix} \begin{bmatrix} re^{i\theta} & 0 \\ 0 & re^{-i\theta} \end{bmatrix} \begin{bmatrix} | & | \\ (u' - v'i) & (u' + v'i) \\ | & | \end{bmatrix}^{-1} \sqrt{2}$$

where $u' = \cos(\phi)u + \sin(\phi)v$ and $v' = -\sin(\phi)u + \cos(\phi)v$ for any angle ϕ .

4. Vector Fields and Stability

For each of the A matrices in Question 1, consider the system differential equation

 $\dot{x} = Ax$

(PTS: 0-2) What are the eigenvalues of e^{At} ? (PTS: 0-2) Decide if the system is stable. (PTS: 0-2) Sketch the vector field for each system labeling the eigenvectors and show a sample trajectory.
